

Installation of Mr. Hunka

Our customer, Mr. Hunka, has longer experience with solar panels and batteries. First, he used a small 40 W panel for the solar motorbike (it was also exhibited on the fair-trade grounds), then he used it on the roof of his house. He was using our LiFePO4 batteries also for electric vehicles. Currently he gets for his house 600 W from a wind mill and over 1.5 kW from solar panels. The gained energy is used to power home appliances that are usually working 24 hours a day. At the time of our last communication he added that he would install the last panel from our GWL Power during the week. He will also add a battery to the system and he counts he will not get under 80% of the battery's discharge even in case of unfavorable conditions.
